

METALLIC BONDING – DIAGRAM B

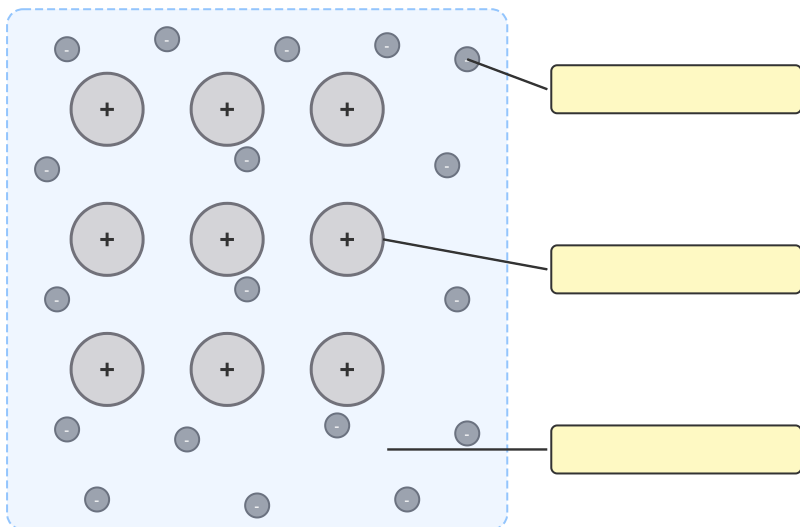

Interpretation & Practice

Metallic bonding is the strong electrostatic attraction between **positive metal ions** and **delocalised electrons**.

1 LABEL THE STRUCTURE

Label the diagram using the terms in the box below.

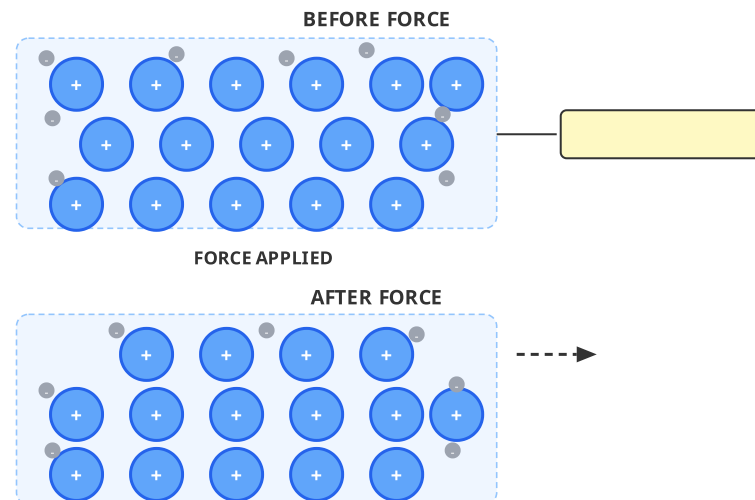

delocalised electrons positive metal ions layers can slide

2 MALLEABILITY

The diagram shows layers of metal ions. When a force is applied, the layers can slide over each other.

Explain why the layers of ions can slide over each other.

TIP: Positive metal ions are held in a 'sea' of delocalised electrons.

Think: What property of metals does this structure explain?
