Date: _____

MULTIPLICATION, (MIXED TIMES TABLE PRACTICE)

LO: I can fluently recall and use multiplication and division facts up to 12×12 .

What is times-table fluency?

Fluency means recalling a **multiplication fact** in under 2 seconds, without counting on fingers.

Tip: Each multiplication gives you **two** division facts. e.g. $6 \times 7 = 42$, so $42 \div 6 = 7$ and $42 \div 7 = 6$.

Spot the table

●	$8 \times 6 = 48$	fact
●	$48 \div 6 = 8$	linked
●	$7 \times 9 = 63$	fact
●	$7 \times 8 = 54$	should be 56
●	$9 \times 6 = 56$	should be 54

Key idea

Multiplication is commutative: $a \times b = b \times a$. So you only need to learn HALF the table.

$$7 \times 8 = 8 \times 7 = 56$$

Same answer either way

MODELLED EXAMPLES

Study each example carefully before attempting the practice questions.

Example 1 - fact recall

Calculate 7×8

$$\begin{aligned} \text{Think: } 7 \times 8 &= 8 \times 7 \\ &= (7 \times 7) + 7 \\ &= 49 + 7 \end{aligned}$$

$$= 56$$

If you know $7 \times 7 = 49$, just add one more 7.

Example 2 - missing factor

Solve: $6 \times \underline{\quad} = 54$

$$\begin{aligned} 54 \div 6 \\ \text{Count up in 6s: } 6, 12, \dots, 54 \\ = 9 \end{aligned}$$

$$= 9$$

9 sixes make 54.

Example 3 - division

Calculate $72 \div 9$

$$\begin{aligned} \text{Think: } 9 \times \underline{\quad} &= 72 \\ 9 \times 8 &= 72 \\ &= 8 \end{aligned}$$

$$= 8$$

Use multiplication to check: $9 \times 8 = 72$

Example 4 - two-step

Calculate $(4 \times 6) + (3 \times 7)$

$$\begin{aligned} 4 \times 6 &= 24 \\ 3 \times 7 &= 21 \\ 24 + 21 &= 45 \end{aligned}$$

$$= 45$$

Do each multiplication first, then add.
